Q: How to move a program (located in a subfolder of app) from one folder to another I have a Phonegap based Android App and I got it to work on my phone and it is also working on other phones as well. My phone is rooted. The app folder contains folders/subfolders, like 'www', 'assets', and 'google-api-client-1.22.4.jar'. This second folder contains the main app. Currently, my Phonegap app is inside the www folder. If i want to move the app to the assets folder so that it becomes an auto-installing app, I need to do the following: Makes the app folder structure: Choose the assets folder, copy everything inside and paste it in the same folder. Copy the app file from its normal location inside the www folder (android or android-obj), paste it inside the new assets folder. Then point my app to the new location. This is super time consuming! I spent a lot of time downloading the files, creating a new app, and downloading the original files back. So my question is, is there a way to just move a program from one directory to another, without having to do the above step? Perhaps moving the whole www folder to the assets folder? A: I do this manually by copying the code of my app to a zip file, then unzip it to my app folder. If you don't want to (or don't know how to) zip the app, you can always just move the files directly (with their original extension). Alternatively, you can include your files using a webview (android-webview), which makes the installation process as simple as setting a meta-data. The webview would embed your files and make them accessible directly. Regarding the installation, you just have to Set the meta-data of the app on the Android manifest (meta-data) Specify the installation path of the webview (src) This means that the webview does exactly what you want (more or less). Check the documentation here: [EDIT] If you want to create your own custom webview, you could: Create a class (Java) inheriting WebView (which supports meta-
