Apoptosis and autophagy induction by androgens in PC3 cells is related to caspase 3 activation. Androgens are essential for prostate growth and development. The cell death process plays an important role in the response of cells to androgens. This study investigated the effects of androgens on the induction of apoptosis and autophagy in human prostate cancer PC3 cells. PC3 cells were treated with 5 α -dihydrotestosterone, a non-aromatizable androgen, and 17 β -estradiol, a nonaromatizable, endogenous estrogen. Compared to control, 5 α -dihydrotestosterone treatment caused a significant increase in the number of apoptotic cells and the expression of apoptosis-related proteins and genes, such as pro-apoptotic caspase 3 and p53, and anti-apoptotic Bcl-2 and Bcl-XL. After 17 β -estradiol treatment, the number of apoptotic cells increased and the expression of apoptosis-related genes and proteins was upregulated. The number of autophagic vacuoles was reduced after 5 α -dihydrotestosterone and 17 β -estradiol treatments. The caspase inhibitor z-DEVD-FMK abrogated 5 α -dihydrotestosterone-induced apoptosis, indicating that 5 α -dihydrotestosterone induced apoptosis through the activation of caspase 3. These results suggested that the treatment of PC3 cells with androgens could induce apoptosis and autophagy. Moreover, apoptosis and autophagy induced by 5 α -dihydrotestosterone was related to caspase 3 activation. The present invention relates to devices which are capable of detecting and interpreting data from underground pipes. More particularly, the invention relates to a device which is attachable to the outside of a pipe and which includes a hydrophone which is capable of detecting and interpreting acoustic signals indicative of different states of the pipe. The detection of surface breaks in buried pipes is generally performed by visual inspection techniques. A visual inspection is not a desirable method for
